

Local Navigation Pseudocode

Basics of Mobile Robotics

Bubble Rebound Algorithm as proposed in this paper: I. Susnea, A. Filipescu, G. Vasiliu, G. Coman and A. Radaschin, "The bubble rebound obstacle avoidance algorithm for mobile robots," IEEE ICCA 2010, 2010, pp. 540-545, doi: 10.1109/ICCA.2010.5524302.

The pseudocode was inspired by the implementation of this algorithm on a simulator by a lua plugin that can be found here: <https://github.com/BeBeBerr/bubble-rebound>

The pseudocode written has some variation with what has been implemented due to numerous unknown parameters around the robot class implementation.

Bubble Rebound pseudocode:

Function : Check For Obstacles	
Input : Sensor readings	Output : Binary value for obstacle
<pre> Function (sensors): threshold_array = VALUE for i from 1 to 5 with a step of 1: if sensors[horizontal][i] > threshold_array return true end if end for return false end function </pre>	

Function : Get angle	
Input : Sensor readings	Output : angle
<pre> Function Get angle(sensors): alpha = 80 / 5 alpha_array = alpha * [-2 -1 0 1 2] tmp1, tmp2 = 0 for i from 1 to 5 tmp1=tmp1+alpha_array[i]*sensor[horizontal][i] tmp2=tmp2+sensor[horizontal][i] end for return tmp1/tmp2 end function </pre>	

Function : Set speed

Input : linear, angular	Output : motor speed
Function Set speed(linear, angular): rspeed = linear + angular/2 lspeed = linear - angular/2 motor_speed=[rspeed lspeed] return motor_speed end function	

Function : Turn	
Input : robot position, turn_speed	Output :
Function turn(linear, angular): last_angle_pos = robot position[angle] sum_angle = 0 turn_condition = true current_angle_pos = robot position[angle] delta = absolute value(current_angle_pos-last_angle_pos) last_angle_pos = current_angle_pos sum_angle = sum_angle + delta if angle > 0 rtn_speed=Set Speed(0, turn_speed) else rtn_speed=Set Speed(0, -turn_speed) end if if sum_angle > angle rtn_speed=Set Speed(0,0) end if return rtn_speed end function	

Function : main local navigation	
Input : sensor readings	Output : motor speed
Function main local navigation(sensor readings): while true if Check For Obstacles(sensor readings) Turn(Get Angle(sensor readings)) sleep function end function
